Deep learning tools for text and images bring real gains. Yet they raise deep ethical worries. We need safeguards as we advance, beyond mere hype.

Key dangers

- .Use of data without consent or legal rights harms artists' efforts and public faith (Birrane and Prabhu, 2021).
- Data holds biases and stereotypes that appear in broad outputs and future picks (Bender et al., 2021).
- They craft fluent but false facts, which spread lies and erode shared truth (Bommasani et al., 2022).
- They might leak private info from stored personal details by mistake (Carlini et al., 2021).
- Hidden costs hit data labeling and checks, often done by low-paid workers (Bender et al., 2021).

Ways forward

- Manage data well. Track its sources. Get user consent. Follow all rules. Use checks and records (Gebru et al., 2018).
- Test and track: gauge bias, risks, accuracy via firm methods. Run checks pre- and post-release (Bommasani et al., 2022).

- Mark sources: embed watermarks and tags for proof. This traces false items to their roots.
- Keep humans in the loop: draw lines for uses, review key tasks, assign clear duties.

These steps let us craft, apply, and assess AI that solves problems without hurting people.
