Abi's case shows the ethical duty of computing professionals to ensure information stays accurate and honest. As a statistical programmer, he owes duties to the client, Whizzz users, and the public at large. The ACM Code of Ethics demands truthfulness and calls to avoid harm, so overlooking potential health risks breaks key duties (ACM, 2018). The BCS Code of Conduct bars misleading stakeholders through selective or partial reports (BCS, 2015).

If Abi runs numerous analyses yet shares only positive outcomes, he aids false marketing and leaves users open to needless risks. Such actions erode trust in statistics and research as a whole (Resnik, 2018). They might also trigger legal issues over false claims and poor care in safety checks. Good statistical practice demands open methods, full sharing of key results, and clear notes on uncertainties (Gigerenzer, 2004).

Abi must push back against pressure to select findings, record his worries, and consult senior staff or an ethics panel. If the firm demands only upbeat results, he should contest it and alert regulators where needed. Public good and professional standards must rank highest.
